Company: FAMSA

Location: Massongex, Switzerland

Gravel that generates energy for 100 households

Since 1922, FAMSA has been producing hard materials essential for use in mobility applications and public and private construction. Through green, responsible and pioneer thinking, FAMSA is actively involved, day in and day out, in reducing greenhouse gas emissions. The project was designed so that transporting material (from quarry to manufactured site and distribution site) enables energy to be recovered and generated. FAMSA is committed to the natural world, thus marrying economic and environmental sustainability. The proof lies in the entry outlined, which helps to power 100 housholds.
